

Course Project

Let's have a look at the final project for the course.

Project description

You've done beautifully in the Practicum course, and you've been offered an internship in the analytical department at Yandex.Afisha. Your first task is to help optimize marketing expenses.

You have:

- Server logs with data on Yandex.Afisha visits from January 2017 through December 2018
- Dump file with all orders for the period
- Marketing expenses statistics

You are going to study:

- How people use the product
- When they start to buy
- How much money each customer brings
- When they pay off

Instructions for completing the project

Step 1. Download the data and prepare it for analysis

Store the data on visits, orders, and expenses in variables. Optimize the data for analysis. Make sure each column contains the correct data type.

File paths:

`/datasets/visits_log_us.csv`

/datasets/orders_log_us.csv

/datasets/costs_us.csv

Step 2. Make reports and calculate metrics:

1. Product

1. How many people use it every day, week, and month?
2. How many sessions are there per day? (One user might have more than one session.)
3. What is the length of each session?
4. How often do users come back?

2. Sales

1. When do people start buying?
2. How many orders do they make during a given period of time?
3. What is the average purchase size?
4. How much money do they bring? (LTV)

3. Marketing

1. How much money was spent? Overall/per source/over time
2. How much did customer acquisition from each of the sources cost?
3. How worthwhile were the investments? (ROI)

Plot graphs to display how these metrics differ for various devices and ad sources and how they change in time.

Step 3. Write a conclusion: advise marketing experts how much money to invest and where.

What sources/platforms would you recommend? Back up your choice: what metrics did you focus on? Why? What conclusions did you draw after finding the metric values?

Format: Complete the task in Jupyter Notebook. Enter the code in *code* cells and text explanations in *markdown* cells. Apply formatting and headings.

Description of the data

The `visits` table (server logs with data on website visits):

- *Uid* — user's unique identifier
- *Device* — user's device
- *Start Ts* — session start date and time
- *End Ts* — session end date and time
- *Source Id* — identifier of the ad source the user came from

The `orders` table (data on orders):

- *Uid* — unique identifier of the user making an order
- *Buy Ts* — order date and time
- *Revenue* — Yandex.Afisha's revenue from the order

The `costs` table (data on marketing expenses):

- *source_id* — ad source identifier
- *dt* — date
- *costs* — expenses on this ad source on this day

How will my project be assessed?

Your project will be assessed on these criteria. Read over them carefully before you start the project.

Here's what project reviewers look for when assessing your project:

- How you prepare the data for analysis
- What graphs you plot for metrics

- How you interpret the resulting graphs
- How you calculate and interpret each parameter
- How you back up your recommendations for marketing experts and what metrics you use
- Whether you follow the project structure and keep the code tidy
- The conclusions you come to
- Whether you leave comments at each step
